Most of the programs described in this report are funded through the

Federal Aid in Wildlife Restoration

Program. This program initiated in 1937 as the Federal Aid In Wildlife Act and created a system where by taxes are paid on firearms, ammunition and archery equipment by the public who hunts. Today this excise tax generates over a hundred million dollars each year that are dedicated to state wildlife restoration and management projects across the United States. The State of Vermont use these monies for acquiring land, and for restoring and managing wildlife. These excise tax dollars, coupled with state hunting license fees have been the predominate source of money funding the successful restoration and management of Vermont's wildlife resources.

2003 VERMONT WILDLIFE HARVEST REPORT

Protecting the integrity, diversity and vitality of Vermont's fish, wildlife and plants and their habitats for the people of Vermont.

2003 White-tailed Deer Report

Overview of Hunting Seasons and Biological Analysis

The winter of 2003 was the second severe winter in the last three years and was directly related to the decline in Vermont's overall deer harvest for 2003. Further compounding the anticipated harvest decline was the lack of important fall foods such as beechnuts, acorns and apples. Despite these obstacles to an abundant harvest, archery and youth season totals were 12% and 7%, respectively, greater than 2002. The muzzleloader season total was down 28%, largely due to the 24% decrease in antlerless permits. The rifle deer season experienced the greatest difference (-21%) and accounts for most of the 13% decrease in total deer harvest between 2002 and 2003.

Hunters harvested a total of 14,528 deer in 2003. Rifle season hunters harvested 47% of that total while archery (27%), youth (11%), and muzzleloader hunters (15%) comprised the balance (Figure 1). Bucks having antlers three inches or longer made up 63% of the total harvest in 2003 (Figure 2). This compares with 67% of the 2002 harvest.

Results of the 2003 seasons are listed by wildlife management unit (WMU) and by town in Tables 1 and 2 at the end of this report.

Of the 12,499 licensed hunters who harvested at least one deer, 88% took one deer, 10% two deer, and 2% three deer. Based on an estimated 87,000 licensed hunters, 86% did not harvest a deer.

The total buck harvest of 9,194 is 21% less than the harvest objective (Figure 6) and similar to the buck harvest of 2001 when the winter severity was also high. Buck harvests for individual WMU's ranged between 33% greater and 58% less than their respective harvest objectives (Figure 7).

Biologists examined 709 bucks at 17 different check stations during the first weekend of the rifle season. This was 28% fewer deer than in 2002 and consistent with the rifle season harvest of 2003. Data analysis resulted in a mean antler beam diameter for yearling ($1\frac{1}{2}$ year old) bucks of 16.5 millimeters. Their mean number of points was 2.9 and their dressed weight (all internal organs removed) was 114.1 pounds. These results indicate the deer herd entered the stressful wintering period in excellent condition.

Based on tooth wear and replacement patterns, the age distribution of the bucks were 66%- $1\frac{1}{2}$ year olds, 19%- $2\frac{1}{2}$ year olds, 11%- $3\frac{1}{2}$ year olds, and 4%- $4\frac{1}{2}$ years or older (Table 3). This age distribution has a higher proportion of $1\frac{1}{2}$ year olds than in most years. Usually the percentage of yearlings ranges between 50% and 60%. When the yearling frequency is high it is often related to a mild winter and high fawn survival. The reasons for 2003 being as high as it is are unknown but could be related to high fawn survival, the prevailing hunting conditions, or a sampling problem.

14,528 DEER HARVESTED

2003 HARVEST TOTALS BY SEASON

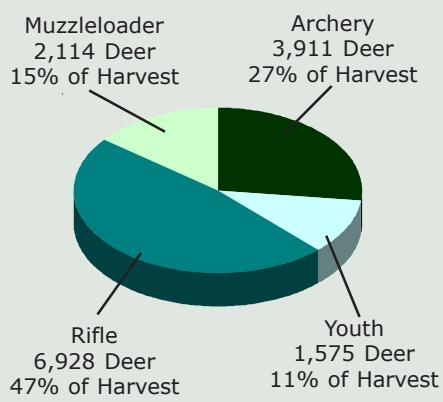

Figure 1

AGE AND SEX DISTRIBUTION OF HARVEST

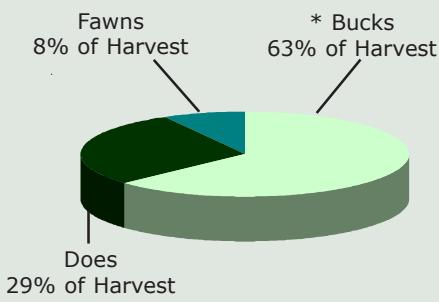

Figure 2

Archery Season

October 4-26 and December 6-14, 2003

Of the 14,528 deer harvested, 3,911 were harvested during the split four-week archery season. Bucks with three-inch or longer antlers made up 31% of the harvest and does and fawns made up 55% and 14%, respectively (Figure 3). Of the estimated 30,000 archers, 11% harvested one deer and 1% harvested two deer. Among successful archery hunters 89% harvested one deer and 11% harvested two deer. Bucks comprised 31% of the first deer harvested but only 23% of the second deer. Hunters harvested 206 deer in the December portion of the archery season. For 116 hunters that portion of the harvest was their first deer harvested.

Youth Season

November 8 and 9, 2003

Hunters under the age of 16 took to the field for the second year of a hunt expanded to both weekend days. Despite little snow and extremely cold temperatures youths harvested 1,575 deer. This represents a 7% increase from the 2002 harvest of 1,474 deer. This year's harvest represents 11% of the total 2003 deer harvest. The composition of the harvest remained similar to that of previous youth seasons and was distributed as 27% bucks with three-inch or longer antlers, 48% does and 25% fawns (Figure 4).

Rifle Season

November 15 – November 30, 2003

A good snowfall greeted hunters for the opening weekend of the rifle deer season. Despite reasonably good hunting conditions for these two days the harvest was down 27% from 2002. Losses due to the severe winter of 2003 were apparent at 15 of the 17 biological check stations. Southern stations reported the greatest differences. A warming trend during the middle of the season diminished the effect of the early season snowfall. Thanksgiving weekend began cold and clear and moderated on the final day when good tracking snow was once again available.

Hunters harvested a total of 6,928 bucks during the 16-day season. This season's harvest represents a total that was 21% less than in 2002. Of that total, 88% of the deer were a hunter's first deer taken that year. Harvest during the first two days of the season accounted for 42% of the rifle season total.

Results of the 2003 hunter effort survey indicated there was relatively high hunting pressure during opening weekend and modest pressure on the following two weekends. Weekday hunting pressure was about 55% of what occurred on opening weekend.

Muzzleloader Season

December 7 – 15, 2003

Hunting conditions were good to excellent during the final deer season of the year. Due to the 24% decrease in antlerless permits from 2002, the muzzleloader harvest was expected to be lower than the previous year. The harvest of 2,114 fell in line with that expectation. The composition of the muzzleloader season was 31% bucks with three-inch or longer antlers, 59% does and 10% fawns (Figure 5). Antlerless permit applications were received from 17,847 applicants for the 7,485 authorized permits (Table 5).

Summary

This was the third consecutive year the statewide buck harvest has been below the management plan's objective, due primarily to the severity of the winters in 2001 and 2003. Concern for a decreasing deer population as well as for a relatively low frequency of older aged bucks has been expressed by increasing numbers of hunters. Recognizing hunter sentiment, the department is exploring having experimental WMUs where hunting regulations would be changed to decrease the mortality on young (1.5 year old) bucks. This approach is being labeled Comprehensive Deer Management (CDM). The earliest any change in hunting regulations would take effect would be 2005.

Bucks having heavy body weight are of interest to many hunters. Although large-bodied bucks are most often associated with areas of the state where hunting pressure is low, Table 4 indicates that large-bodied bucks also sometimes can be found in regions of the state where hunting pressure is relatively high.

Notable Weights of Vermont's Harvested Big Game Wildlife

This program keeps track of some of the largest black bear, white-tailed deer and moose taken by legal means in Vermont each year. All animals recorded must be completely field dressed. Wildlife listed here have been entered in to this program based on a submission by the hunter to the department.

Cleaned field dressed weight: All animals must be reported completely field dressed (all internal organs removed, including heart, liver and lungs). By completely field dressing your deer, bear or turkey immediately after tagging you insure the most rapid cooling of the body cavity and the least amount of coagulated blood, and thus the least amount of meat will be at risk of spoilage.

It is your responsibility as a sportsperson to properly care for your game and use it fully. If you take more meat than you and your family can consume within a year, you will easily find friends, relatives and/or local food shelves that will gladly accept your surplus meat. By properly dressing your game you will help to ensure that the meat you consume or give away will be of the finest possible quality.

Points: points are defined as 1 inch above the antler beam.

FIVE HEAVIEST REPORTED BLACK BEAR BY WEIGHT

Year	Weight (lbs.)	Town Harvested
1986	514	Lemington
1985	441	Jay
2001	383	Brookfield
1985	383	Irasburg
1995	363	Ferdinand
