

2018 VERMONT WHITE-TAILED DEER HARVEST REPORT

FISH & WILDLIFE DEPARTMENT
(802) 828-1000 / www.vtfishandwildlife.com

Most of the programs described in this report are funded through the *Federal Aid in Wildlife Restoration Program*. This program was initiated in 1937 as the Federal Aid in Wildlife Act and created a system whereby taxes are paid on firearms, ammunition and archery equipment by the public who hunts. Today this excise tax generates more than one hundred million dollars each year that are dedicated to state wildlife restoration and management projects across the United States. The State of Vermont uses these monies for acquiring land, and for restoring and managing wildlife. These excise tax dollars, coupled with state hunting license fees, have been the predominant source of money funding the successful restoration and management of Vermont’s wildlife resources.

2018 White-tailed Deer Harvest Report

Overview

Hunters harvested a total of 19,011 deer during the four Vermont deer seasons in 2018, providing about 3.8 million servings of local, nutritious venison. The total harvest was 27 percent more than the previous 3-year average (14,984), and the buck harvest was 8 percent more than the previous 3-year average (9,267 bucks). The overall harvest was 19 percent more than 2017 (15,984), and the total buck harvest of 10,028 was 6 percent more than the 2017 buck harvest (9,477; Figure 1).

Hunting conditions were generally good during the 2018 hunting seasons. Statewide surveys conducted in 2018 indicated that apple, beechnut, and oak mast production were all fair to poor. With limited mast available, deer tend to concentrate near available food sources and utilize fields more often which makes them more accessible to hunters. Additionally, cool weather persisted for most of the October archery season, causing deer to move more during the day. Cold, blustery conditions limited the harvest on youth weekend and the opening weekend of rifle season. However, widespread, occasionally substantial, snow cover through November and December further concentrated deer and helped hunters locate them. This helped increase the harvest, particularly during the muzzleloader season.

The Vermont Fish & Wildlife Department estimated no substantial change (1 percent increase) in the deer population from 2017 to 2018. This was primarily due to increased antlerless harvests in 2016 and 2017 and a more moderate

Figure 1. Annual antlered buck and total deer harvest in Vermont, 1900-2018.

winter in 2018 (albeit still below average). Each winter, a Winter Severity Index (WSI) is calculated from 38 weather stations throughout Vermont. Points are accumulated for each day when temperatures are 0 degrees Fahrenheit or below or the snow depth is 18 inches or more. The statewide average WSI for 2018 was 38.4, slightly below the 30-year average of 43.9 (Figure 2). While population stability is usually desirable, in this case it meant that deer populations in many parts of Vermont remained above established objectives. Therefore, the number of muzzleloader season antlerless permits was increased to provide additional harvest opportunity and to reduce populations in some parts of the state and limit population growth in other areas.

The primary goal of Vermont's deer management strategy is to keep the deer herd stable, healthy, and in balance with available habitat. Deer that go into winter with heavier body weights are better able to survive harsh winter conditions, and high reproductive rates mean the population can rebound quickly. This helps to minimize the boom and bust cycles that have historically characterized Vermont's deer population and harvest (Figure 1). Fawn weights, yearling buck antler size, and reproductive data from road-killed deer indicate populations in much of Vermont

have reached or exceeded the carrying capacity of their habitat. Allowing an appropriate number of antlerless deer to be harvested helps to keep populations from becoming overabundant, and thereby helps to keep the deer and their habitats healthy and productive.

Figure 2. Statewide winter severity index (WSI) in Vermont, 1989-2018. The horizontal dashed line shows the 30-year average WSI of 44.

Season Results

Antlered bucks comprised 53 percent of the total harvest, while 38 percent were adult does, 3 percent were male fawns, and 6 percent were female fawns (Figure 3, Table 1). Rifle season accounted for 39 percent of the total deer harvest, while 21 percent were harvested during archery season, 33 percent during muzzleloader season, and 7 percent during youth season (Figure 4, Table 1).

Archery Season (October 6–November 2, December 1–9, 2018)

Archers harvested 3,984 deer during the split 37-day archery season (28 days in October–November and 9 days in December). This was up 11 percent from the 2017 harvest (3,578) and was 14 percent more than the previous 3-year average (3,481). The archery harvest was composed of 24 percent antlered bucks, 64 percent adult does, and 12 percent fawns (Figure 5, Table 1). The late archery season accounted for 6 percent (250 deer) of the overall archery harvest and 2 percent (22 deer) of the archery buck harvest. Hunters using crossbows accounted for 40 percent of the harvest, up from 34 percent in 2017 and 32 percent in 2016. Crossbows became legal for all hunters age 50 or older for the first time in 2016. In 2015, crossbows accounted for 14 percent of the archery harvest.

The prevalence of does in the archery harvest demonstrates that bow hunting is an important mechanism for deer population management. Harvesting does helps prevent overabundant and unhealthy deer. All wildlife management units were open to the taking of antlerless deer during the archery season in 2018.

Youth Season (November 3–4, 2018)

Youth hunters harvested a total of 1,342 deer during the 2-day youth season. This was 8 percent less than 2017 (1,462), and similar to the previous 3-year average (1,392). The youth harvest was composed of 32 percent antlered bucks, 47 percent adult does, and 21 percent fawns (Figure 6, Table 1).

The youth season is particularly important for deer research and management in Vermont. Youth hunters during the youth season can harvest any deer, regardless of sex or antler characteristics. As a result, the youth harvest provides a representative cross-section of the entire deer population, including spike-antlered bucks. Data from harvested does and fawns are also useful for deer management purposes.

Rifle Season (November 10–25, 2018)

Hunters reported a total of 7,480 antlered bucks during the traditional 16-day rifle season. This was a 3 percent increase from 2017 (7,272), and 4 percent more than the previous 3-year average (7,218).

Hunter effort surveys were again mailed to 10,000 randomly selected licensed Vermont hunters in 2018. This survey provides information on the number of hunters actively participating in deer hunting, the amount of time they spend afield, and the number of deer, moose, and other species they see while hunting. These data are used to monitor deer, moose, bear, and furbearer distribution and population trends.

Hunters returned 1,227 valid surveys (12 percent return rate), with 15 percent reporting that they did not hunt during the rifle season in 2018. Hunters reported an average of 37 hours afield during the rifle season which is slightly lower than the previous 3-year average (39 hours). Timing of hunter effort within the rifle season is also useful for modeling population size and harvest rates. As usual, Saturday and Sunday of opening weekend saw the greatest hunting effort and yielded the greatest harvests among all 16 days of the season (Figure 7). Respondents reported a total of 35,946 hunter-hours, equivalent to 18 people working 40 hours per week year-round. Clearly, this volunteer survey effort is more than the department could ever achieve with its own staff.

Hunters reported seeing an average of 3.6 deer per 10 hours of hunting. This was greater than 2017 (2.8 deer/10 hours hunting),

and the highest sighting rate in the history of this survey (since 1999; Table 2). The buck sighting rate of 0.37 per 10 hours of hunting (about 1 buck per 27 hours) was identical to the rate reported in 2017, and the highest buck sighting rate since the department began tracking this number in 2003.

² Prior to 2014, data shown for WMU M are from old WMUs M1 and O1. Data for WMU O are from old WMUs M2 and O2.

Muzzleloader Season (December 1–9, 2018)

Muzzleloader hunters harvested a total of 6,205 deer during the 9-day season. This was 69 percent more than 2017 (3,672) and 114 percent more than the previous 3-year average (2,893). The total harvest and the buck harvest (1,146) were both all-time records for this season, surpassing the previous records (4,656 total deer, 1,006 bucks) set in 2000 by substantial margins. Of the muzzleloader harvest, 18 percent were antlered bucks, 66 percent adult does, and 15 percent fawns (Figure 8, Table 1).

Muzzleloader hunters play an important role in deer management, helping control total deer numbers in Vermont through shooting of antlerless deer. In 2018, a total of 27,000 antlerless deer permits were authorized by the Fish and Wildlife Board for 18 of the state’s 21 wildlife management units (WMUs). This represented a 10 percent increase from the number of permits authorized in 2017 and was intended to reduce deer populations in some parts of Vermont while stabilizing the population in other areas. Antlerless permits were not recommended for WMUs E1, E2, and P, where deer populations were estimated to be below established long-term goals. Permit holder success was 21 percent statewide (5,026 antlerless deer harvested), varying from a high of 33 percent in WMU C to a low of 16 percent in WMU F1 (Table 3).

¹Permits issued through the landowner lottery. These are included in the total number of permits distributed.

Geographic Distribution

Deer are not evenly distributed across Vermont, and neither was the 2018 deer harvest. Deer harvest densities ranged from 5.8 deer/square mile in WMU A to 0.4 deer/square mile in WMU E2 (Figure 9). Areas west of the Green Mountains (WMUs A, B, F1, F2, K, and N) once again accounted for nearly 40 percent of the total deer harvest in 2018 (Table 4) despite having only 24 percent of the state's deer habitat. These areas have productive soils, a lot of farmland, and generally experience easier winter conditions than the rest of the state, allowing them to sustain higher deer densities.

Figure 9. Antlered buck and total deer harvest density by wildlife management unit.

The distribution of the deer harvest changes over time as habitat conditions change. In 2018, 28 towns saw their highest total deer harvests ever, and another 61 towns had total deer harvests among their 10 best (Figure 10). Conversely, 10 towns had total deer harvests that were among their 10 worst since 1960.

Table 6 provides a breakdown of the harvest by county, town, and season. A map of the 2018 deer harvest distribution by town and WMU is available at the end of this report.

Bag Limits

A total of 14,989 individual hunters were successful in harvesting a deer in 2018. Of those, 2,730 (18 percent) harvested two deer, and 646 (4 percent) reached the 3-deer bag limit for all seasons (Figure 11). The percentages of hunters harvesting 2 or 3 deer were greater than those observed in 2017 (15 percent and 2 percent, respectively) or in prior years. Table 5 provides a detailed breakdown of the number of antlered bucks and antlerless deer harvested by individual successful hunters.

Figure 11. Percentage of hunters harvesting 1, 2, or 3 deer in 2018.

Figure 10. Towns with record or near-record total deer harvests in 2018.

Biological Data Collection

Each fall department biologists visit big game reporting stations throughout the state to collect biological information from harvested deer. These data are important for monitoring the health of Vermont’s deer herd and evaluating the effects of deer management strategies. In 2018, the department operated 24 biological reporting stations during the youth season and 10 during opening weekend of the rifle season and examined a total of 915 deer.

Youth season is an important data collection period because youth hunters may harvest any deer regardless of sex, age or antler characteristics. Biologists examined 509 deer (38 percent of the youth harvest) during youth weekend, including 179 antlered bucks, 230 adult does, and 100 fawns. Yearlings accounted for 66 percent of antlered bucks examined during youth weekend, 2-year-olds were 30 percent, and 3-year-olds or older were 4 percent (Table 6).

Data collected during the rifle season provide additional information on age and antler development in legal-antlered bucks and, when compared to youth season data, allow the department to assess the effect of the antler restriction on the harvest. Since 2015, a concerted effort has been made to collect additional data on buck age structure and antler development. Biologists examined 396 antlered bucks (5 percent of the rifle harvest) during the 2018 rifle season.

Additionally, the department asked all successful rifle season hunters to provide a tooth from their deer. This effort resulted in an additional 2,999 teeth (40 percent of the rifle harvest). In

Table 5. Number of Antlered Bucks and Total Deer Harvested by Individual Successful Hunters in 2018

		Antlered Bucks			Total
		0	1	2

	1	5,023	1,592	241	6,856 (46%)
	2	630	348		978 (7%)
	3	57			57 (0%)
Total		5,710 (38%)	8,530 (57%)	749 (5%)	14,989

Table 6. Average Dressed Weights and Antler Beam Diameters (ABD) of Deer Examined at Biological Reporting Stations During Youth Season

	Age	Weight (lbs)	ABD (mm)	Sample Size	% of Adults
Males	0	66.5		51	
	1	116.4	16.3	115	66%
	2	151.2	22.0	52	30%
	3	170.2	31.6	5	3%
	4+	166.0	33.3	2	1%
	Age	Weight		Sample Size	% of Adults
Females	0	55.5		46	
	1	98.1		35	16%
	2	108.8		49	22%
	3	111.1		42	19%
	4+	118.8		99	44%

total, accurate age information will be available for 45 percent of the rifle buck harvest and 36 percent of the total buck harvest. These data will allow for comparison of age distribution and antler development among different regions of the state and improve the precision of statewide and regional population estimates.

Looking to the Future

The winter of 2018–2019 has been harder than average in central and northern Vermont, but relatively easy in western Vermont and along the Connecticut river valley. In many areas, snow has persisted since early November. Winter severity in March and April has the greatest effect on overwinter deer survival, so it's too early to make predictions. However, the winter severity index will certainly be above average in most areas and may reach severe levels in some areas. This means there will be fewer deer in 2019 than there were in 2018. Unfortunately, the areas where population reductions are most needed are not the areas experiencing a severe winter.

In 2018, the department was once again left with unallocated muzzleloader antlerless deer permits in WMUs A, F1, K, N, O, and Q (Table 3). It is very likely that there were more permits available in these units than there are muzzleloader hunters. In order to responsibly manage deer in these units, it will be necessary to find alternative ways to harvest antlerless deer and thereby control deer numbers. For example, the antlerless harvest in WMU N could be doubled with little or no impact on the population (compare WMUs N and B in Figure 9) and would need to be increased even further to achieve the population objectives established in the 2010–2020 Big Game Management Plan. If too few does continue to be taken, the deer herd in southwestern Vermont will become unhealthy and susceptible to drastic winter losses and disease. Deer from this region already have consistently lower body weights and smaller antlers than deer from other parts of the state. Habitats damaged by overabundant deer take longer to recover than reduced deer numbers. Some parts of Vermont are still dealing with habitat impacts caused by overabundant deer decades ago.

Hunters play a critical role in the management of deer in Vermont. They provide the mechanism for controlling deer numbers and they provide useful biological information from the animals they harvest. Some rifle season hunters also provide valuable information on hunting effort and sighting rates of deer, moose, and other species. Hunters have a responsibility to contribute to the sound management of these species, yet only 12 percent of rifle season hunter effort surveys were returned in 2018. Low return rates for this survey, as well as other surveys, make the information less useful and limit the department's ability to estimate population sizes of deer, moose, bear, and other species. To counteract these poor return rates, the department opened the online version of the deer hunter effort survey to all hunters in 2018. This did increase the number of respondents, but we are still evaluating whether these voluntary data are comparable to the data received from

survey recipients. While these data should be useful in the future, they will not eliminate the challenges created by poor return rates.

Comprehensive Deer Management Evaluation

The Fish & Wildlife Department completed phase II of our comprehensive deer management evaluation in 2018 and published a final report in early 2019. This evaluation looked at the effects of regulation changes passed in 2016 (e.g., archery season extension, allowing crossbows for hunters aged 50 and older), evaluated the effects of the antler restriction on the buck population and the buck harvest, and assessed options for further changes to the timing and structure of the deer hunting seasons.

In early 2019 the department recommended a broad package of changes to deer hunting regulations. These changes are intended to improve hunter opportunity and hunter satisfaction while simultaneously improving the department's ability to manage the deer herd. Additional details, and the current status of this proposal, can be found at vtfishandwildlife.com

2020–2030 Big Game Management Plan

The department is in the process of developing a new 10-year Big Game Management Plan for Vermont's four big game species. The plan identifies the major issues facing each species, establishes management goals, and guides management actions for the next decade. There will be lots of opportunity for public involvement during 2019, so hunters with ideas about how these species should be managed, or important issues the department should address, will have ample opportunity to let the department know.

Heaviest Deer

A total of 141 deer were reported with scaled weights of 200 pounds or more. The heaviest deer weighed 260 pounds and was taken in the town of Guildhall. At least one 200-pound deer was

reported from every WMU. For more information on large deer harvested in Vermont, visit the Vermont Big Game Trophy Club website at vermontbiggametrophyclub.com.

Figure 12. Distribution of Vermont's 2018 deer harvest by town and wildlife management unit.

Each dot represents a single deer harvested in the underlying town and wildlife management unit. Dots do not show the exact location of harvest, and some dots may not be visible on the map.
