Most of the programs described in this report are funded through the *Federal Aid in Wildlife Restoration Program*. This program was initiated in 1937 as the Federal Aid in Wildlife Act and created a system whereby taxes are paid on firearms, ammunition and archery equipment by the public who hunts. Today this excise tax generates more than one hundred million dollars each year that are dedicated to state wildlife restoration and management projects across the United States. The State of Vermont uses these monies for acquiring land, and for restoring and managing wildlife. These excise tax dollars, coupled with state hunting license fees, have been the predominant source of money funding the successful restoration and management of Vermont’s wildlife resources.

2019 White-tailed Deer Harvest Report

Overview

Hunters harvested a total of 16,550 deer during the four Vermont deer seasons in 2019, providing about 3.3 million servings of local, nutritious venison. The total harvest was 3 percent less than the previous 3-year average (17,072), while the buck harvest was 2 percent more than the previous 3-year average (9,833 bucks). The overall harvest was 13 percent less than 2018 (19,011), while the total buck harvest of 10,058 was nearly identical to the 2018 buck harvest (10,028; Figure 1).

Hunting conditions were generally good during the 2019 seasons. Weather during October was close to normal while November was cold and snowy. Cold weather increases deer movement and snow cover helps hunters locate and see deer. The muzzleloader season saw relatively poor conditions, alternating between heavy rain events and noisy, frozen conditions. Statewide surveys conducted in 2019 indicated that apple, beechnut, and oak mast production were all good to excellent. With widespread mast available, deer tend to be more spread out on the landscape and are often less accessible to hunters.

The Vermont Fish & Wildlife Department estimated a 13 percent decrease in the deer population from 2018 to 2019. This was primarily due to the severe winter of 2019 in central and northeastern Vermont as well as increased antlerless harvests in many areas in recent years. Each winter, a Winter Severity Index (WSI) is calculated from 38 weather stations throughout Vermont. Points are accumulated for each day when temperatures are 0 degrees Fahrenheit or below or the snow depth is 18 inches or more. The statewide average WSI for 2018 was 68.6, well above the 30-year average of 44.7 (Figure 2). In response, the number of muzzleloader season antlerless permits was reduced in central and northeastern WMUs. Permit numbers remained similar to previous years in other WMUs to reduce populations in some areas and limit population growth in other areas.

Figure 1. Annual antlered buck and total deer harvest in Vermont, 1900–2019.

The primary goal of Vermont’s deer management strategy is to keep the deer herd stable, healthy, and in balance with available habitat. Deer that go into winter with heavier body weights are better able to survive harsh winter conditions, and high reproductive rates mean the population can rebound quickly. This helps to minimize the boom and bust cycles that have historically characterized Vermont’s deer population and harvest (Figure 1). Fawn weights, yearling buck antler size, and reproductive data from road-killed deer indicate populations in much of Vermont have reached or exceeded numbers that the current habitat can support long-term. Harvesting an appropriate number of antlerless deer helps keep populations from becoming overabundant, and thereby helps keep the deer and their habitats healthy and productive.

Figure 2. Statewide winter severity index (WSI) in Vermont, 1990–2019. The horizontal dashed line shows the 30-year average WSI of 44.

Season Results

Antlered bucks comprised 61 percent of the total harvest, while 33 percent were adult does, 3 percent were male fawns, and 3 percent were female fawns (Figure 3, Table 1). Rifle season accounted for 45 percent of the total deer harvest, while 23 percent were harvested during archery season, 22 percent during muzzleloader season, and 10 percent during youth season (Figure 4, Table 1).

Archery Season (October 5–November 1, December 7–15, 2019)

Archers harvested 3,748 deer during the split 37-day archery season (28 days in October–November and 9 days in December). This was down 6 percent from the 2018 harvest (3,984) but was 2 percent more than the previous 3-year average (3,677). The archery harvest was comprised of 28 percent antlered bucks, 64 percent adult does, and 8 percent fawns (Figure 5, Table 1). The late archery season accounted for 6 percent (212 deer) of the overall archery harvest and 2 percent (23 deer) of the archery buck harvest. Hunters using crossbows accounted for 41 percent of the harvest, up slightly from 40 percent in 2018.

The prevalence of does in the archery harvest demonstrates that bow hunting is an important mechanism for deer population management. Harvesting does helps prevent overabundant and unhealthy deer. All wildlife management units were open to the taking of antlerless deer during the archery season in 2019.

Youth Season (November 9–10, 2019)

Youth hunters harvested a total of 1,637 deer during the 2-day youth season. This was 22 percent more than 2018 (1,342), and 16 percent more than the previous 3-year average (1,413). The youth harvest was comprised of 50 percent antlered bucks, 35 percent adult does, and 15 percent fawns (Figure 6, Table 1).

The youth season is particularly important for deer research and management in Vermont. Youth hunters during the youth season can harvest any deer, regardless of sex or antler characteristics. As a result, the youth harvest provides a representative cross-section of the entire deer population, including spike-antlered bucks. Data from harvested does and fawns are also useful for deer management purposes.

Rifle Season (November 16–December 1, 2019)

Hunters reported a total of 7,502 antlered bucks during the traditional 16-day rifle season. This was similar to 2018 (7,480) and the previous 3-year average (7,502).

Hunter effort surveys were again mailed to 10,000 randomly selected licensed Vermont hunters in 2019. This survey provides information on the number of hunters actively participating in deer hunting, the amount of time they spend afield, and the number of deer, moose, and other species they see while hunting. These data are used to monitor deer, moose, bear, and furbearer distribution and population trends.

Hunters returned 1,754 valid surveys (18 percent return rate), with 23 percent reporting that they did not hunt during the rifle season in 2019. Hunters reported an average of 36 hours afield during the rifle season which is similar to the previous 3-year average (37 hours). Timing of hunter effort within the rifle season is also useful for modeling population size and harvest rates. As usual, Saturday and Sunday of opening weekend saw the greatest hunting effort and yielded the greatest harvests among all 16 days of the season (Figure 7). Respondents reported a total of 41,818 hunter-hours, equivalent to 20 people working 40 hours per week year-round. Clearly, this volunteer survey effort is more than the department could ever achieve with its own staff.

Hunters reported seeing an average of 2.5 deer per 10 hours of hunting. This was lower than 2018 (3.6 deer/10 hours

hunting) and equal to the average sighting rate over the past 10 years (Table 2). The buck sighting rate of 0.34 per 10 hours of hunting (about 1 buck per 29 hours) was slightly lower than the rate reported in 2018 (0.37), but still among the highest buck sighting rates since the department began tracking this number in 2003.

² Prior to 2014, data shown for WMU M are from old WMUs M1 and O1. Data for WMU O are from old WMUs M2 and O2.

Muzzleloader Season (December 7–15, 2019)

Muzzleloader hunters harvested a total of 3,663 deer during the 9-day season. This was 41 percent less than 2018 (6,205) but similar to the harvests in 2016 and 2017 (3,563 and 3,672, respectively). The muzzleloader harvest was comprised of 19 percent antlered bucks, 68 percent adult does, and 13 percent fawns (Figure 8, Table 1).

Muzzleloader hunters play an important role in deer management, helping control total deer numbers in Vermont through the shooting of antlerless deer. In 2019, a total of 23,000 antlerless deer permits were authorized by the Fish and Wildlife Board for 18 of the state's 21 wildlife management units (WMUs). This represented a 15 percent decrease from the number of permits authorized in 2018 in response to the severe winter in some parts of Vermont. Antlerless permits were not recommended for WMUs E1, E2, and P, where deer populations were estimated to be below established long-term goals. Permit holder success was 14 percent statewide (2,966 antlerless deer harvested), varying from a high of 24 percent in WMUs C and D1 to a low of 10 percent in WMU Q (Table 3).

Figure 8. Age and sex distribution of the muzzleloader harvest.

¹Permits issued through the landowner lottery. These are included in the total number of permits distributed.

Geographic Distribution

Deer are not evenly distributed across Vermont, and neither was the 2019 deer harvest. Deer harvest densities ranged from 6.8 deer/square mile in WMU A to 0.3 deer/square mile in WMU E2 (Figure 9). Areas west of the Green Mountains (WMUs A, B, F1, F2, K, and N) once again accounted for about 40 percent of the total deer harvest in 2019 (Table 4) despite having only 24 percent of the state's deer habitat. These areas have productive soils, a lot of farmland, and generally experience easier winter conditions than the rest of the state, allowing them to sustain higher deer densities. WMU B alone accounted for 18 percent of the total harvest with only 7 percent of the total deer habitat.

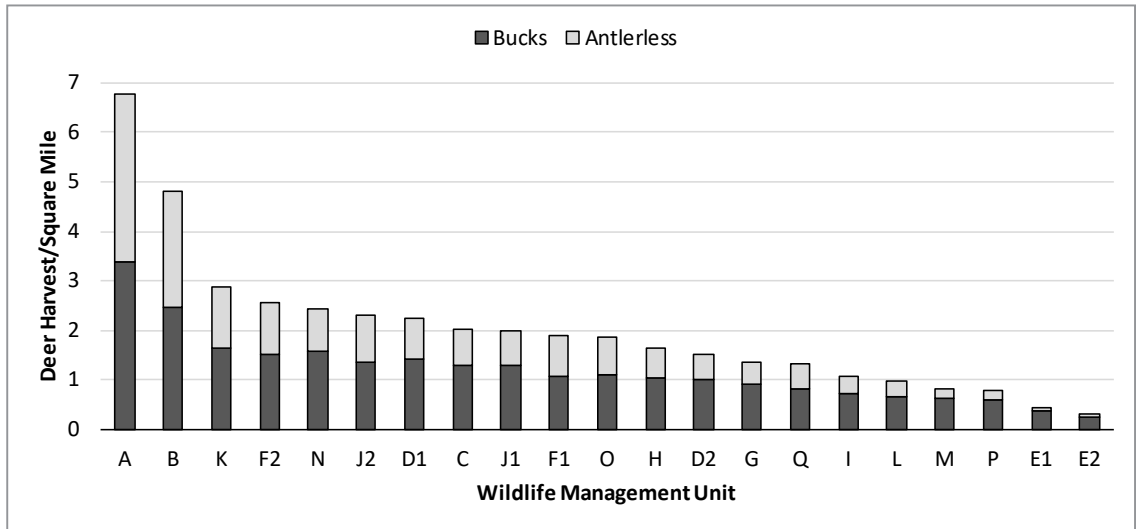

Figure 9. Antlered buck and total deer harvest density by wildlife management unit.

The distribution of the deer harvest changes over time as habitat conditions change. In 2019, 12 towns recorded their highest total deer harvests ever, and another 59 towns had total deer harvests among their 10 best (Figure 10). Conversely, 28 towns had total deer harvests that were among their 10 worst since 1960.

Table 6 provides a breakdown of the harvest by county, town, and season. A map of the 2019 deer harvest distribution by town and WMU is available at the end of this report.

Bag Limits

A total of 13,687 individual hunters were successful at harvesting a deer in 2019. Of those, 2,091 (15 percent) harvested two deer, and 388 (3 percent) reached the 3-deer bag limit for all seasons (Figure 11). The percentages of hunters harvesting 2 or 3 deer were lower than those observed in 2018 (18 percent and 4 percent, respectively) but similar to prior years. Table 5 provides a detailed breakdown of the number of antlered bucks and antlerless deer harvested by individual successful hunters.

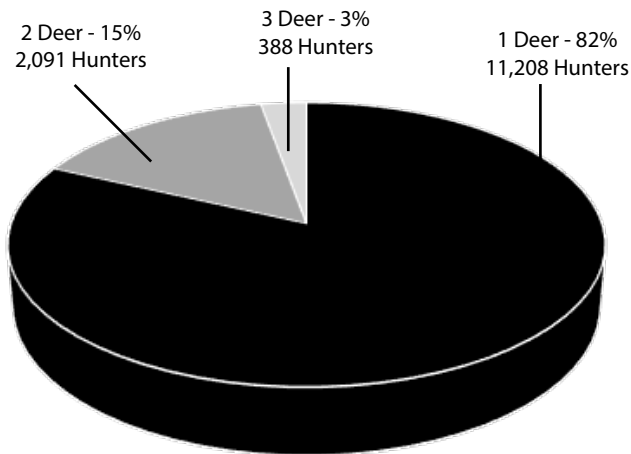

Figure 11. Percentage of successful hunters harvesting 1, 2, or 3 deer in 2019.

Figure 10. Towns with record or near-record total deer harvests in 2019.

Biological Data Collection

Each fall department biologists visit big game reporting stations throughout the state to collect biological information from harvested deer. These data are important for monitoring the health of Vermont’s deer herd and evaluating the effects of deer management strategies. In 2019 the department operated 23 biological reporting stations during the youth season and 9 during opening weekend of the rifle season and examined a total of 1,276 deer.

Youth season is an important data collection period because youth hunters may harvest any deer regardless of sex, age or antler characteristics. Biologists examined 692 deer (42 percent of the youth harvest) during youth weekend, including 360 antlered bucks, 247 adult does, and 85 fawns. Yearlings accounted for 49 percent of antlered bucks examined during youth weekend, 39 percent were 2 years old, and 12 percent were 3 years old or older (Table 6).

Data collected during the rifle season provide additional information on age and antler development in legal-antlered bucks and, when compared to youth season data, allow the department to assess the effect of the antler restriction on the harvest. Since 2015, a concerted effort has been made to collect additional data on buck age structure and antler development. Biologists examined 584 antlered bucks (8 percent of the rifle harvest) during the 2019 rifle season.

Additionally, the department asked all successful rifle season hunters to provide a tooth from their deer. This effort resulted in an additional 2,782 teeth (37 percent of the rifle

Table 5. Number of Antlered Bucks and Total Deer Harvested by Individual Successful Hunters in 2019

		Antlered Bucks			Total
		0	1	2	
Antlerless Deer	0		7,293	478	7,771 (57%)

	2	110.2		49	20%
	3	110.0		40	17%
	4+	118.0		101	42%

harvest). In total, accurate age information will be available for 45 percent of the rifle buck harvest and 37 percent of the total buck harvest. These data will allow for comparison of age distribution and antler development among different regions of the state and improve the precision of statewide and regional population estimates.

Hunter Numbers and License Sales

There were 77,289 licensed hunters in Vermont in 2019. On average, about 85 percent of licensed hunters actually hunt deer in a given year, resulting in an estimated 66,000 active deer hunters in 2019. Hunting and combination license sales continue to decline, but almost one quarter of licensed Vermont hunters now hold lifetime or permanent licenses. Sales of add-on archery and muzzleloader licenses have been stable, suggesting the number of avid deer hunters may not be declining (Figure 12).

Looking to the Future

The winter of 2019-2020 has been relatively easy for deer in much of Vermont. Significant snow didn't arrive until late January, and, although snow cover has been persistent, snow depths have remained relatively shallow in most areas through February. Winter severity in March and April has the greatest effect on overwinter deer survival, so it's too early to make predictions. However, the winter severity index will most likely be below average in most areas. This means deer numbers are likely to increase in many areas in 2020. Unfortunately, population increases are not desirable in most areas, particularly the areas experiencing the mildest winters.

New Deer Hunting Regulations

Some significant changes to deer hunting regulations will take effect in 2020. These changes are the result of the department's Comprehensive Deer Management Evaluation, which began in 2013 and involved significant hunter input as well as collection and analysis of additional biological data from Vermont's deer. The changes are intended to provide hunters with additional opportunities to hunt antlerless deer to maintain a stable and healthy herd. They continue to manage for older, larger-antlered bucks, but in a way that better reflects regional differences and minimizes potential negative effects. Additionally, they are intended to encourage Vermonters to become and remain hunters. A summary of these changes is available in the 2020 law digest and on the department's website. Additional information on the basis for these changes can be found in the department's *Deer Rule Change Recommendation* to the Fish and Wildlife Board and in the *Comprehensive Deer Management Evaluation Final Report*.

New Big Game Management Plan

The department recently completed draft development of the 2020-2030 Big Game Management Plan. The plan identifies the major issues facing each of Vermont's four big game species, establishes management goals, and guides management actions for the next decade.

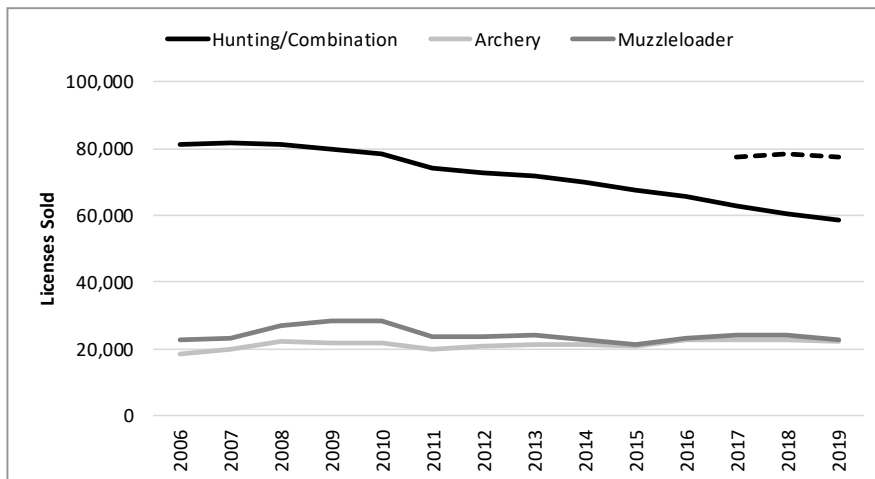

Figure 12. Hunting license sales during 2006-2019. The dotted line represents the total number of licensed hunters, including people who renewed their lifetime or permanent license. Figures include both resident and non-resident licenses.

Heaviest Deer

A total of 88 deer were reported with scaled weights of 200 pounds or more. The heaviest deer weighed 248 pounds and was taken in the town of Norton. At least one 200-pound deer was reported from every WMU except P and Q. For more information on large deer harvested in Vermont, check out the Vermont Big Game Trophy Club.

Figure 12. Distribution of Vermont's 2019 deer harvest by town and wildlife management unit.

Each dot represents a single deer harvested in the underlying town and wildlife management unit. Dots do not show the exact location of harvest, and some dots may not be visible on the map.
